

# HW1

Johnny Tian

## Part A

The scaling frequency evaluates to

$$\omega_0 = \sqrt{\frac{1(10/9 + 10)}{(10/9) \cdot 10}} = 1.$$

Then, the kinematic relations,

$$\dot{x}_1 = x_3, \quad (1)$$

$$\dot{x}_2 = x_4. \quad (2)$$

Then, the remaining dynamics are

$$\dot{x}_3 = \frac{1}{J_1} [-c(x_3 - x_4) - k(x_1 - x_2) + k_f I], \quad (3)$$

$$\dot{x}_4 = \frac{1}{J_2} [-c(x_4 - x_3) - k(x_2 - x_1)]. \quad (4)$$

Substituting numerical values:

$$\dot{x}_3 = -0.9(x_1 - x_2) - 0.09(x_3 - x_4) + 0.9I, \quad (5)$$

$$\dot{x}_4 = 0.1(x_1 - x_2) + 0.01(x_3 - x_4). \quad (6)$$

Then,

$$A = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -0.9 & 0.9 & -0.09 & 0.09 \\ 0.1 & -0.1 & 0.01 & -0.01 \end{bmatrix}, \quad B = \begin{bmatrix} 0 \\ 0 \\ 0.9 \\ 0 \end{bmatrix}.$$

The output is the angular displacement of the external load:

$$y = \varphi_2 = x_2.$$

Thus,

$$C = [0 \quad 1 \quad 0 \quad 0], \quad D = [0].$$

$$\dot{x} = Ax + BI,$$

$$y = Cx$$

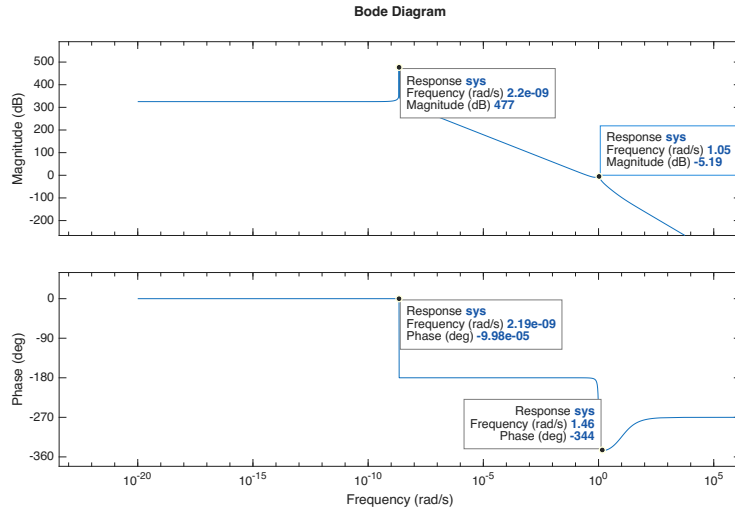

## Part B

1.

the complex conjugate eigen values  $-0.5 \pm i$  indicate system will oscillate with a decaying amplitude.

the 0 eigen values indicate the system is marginally stable.

2.

There are two peaks in the magnitude plot at  $2.2 \times 10^{-9}$  and 1.05 rad/s respectively. The peak at  $2.2 \times 10^{-9}$  rad/s is more dominant.

The first high peak is caused by two spinning disks oscillating against each other as the control frequency gradually increases from DC. Because there are two 0 eigen values, this indicates that there are two integrators in the system, so the phase shifts by 180 degrees.

Then as the frequency increases to 1.05 rad/s, which should be the resonant frequency. At this point the complex conjugate eigen values start to kick in, causing the phase to change further.

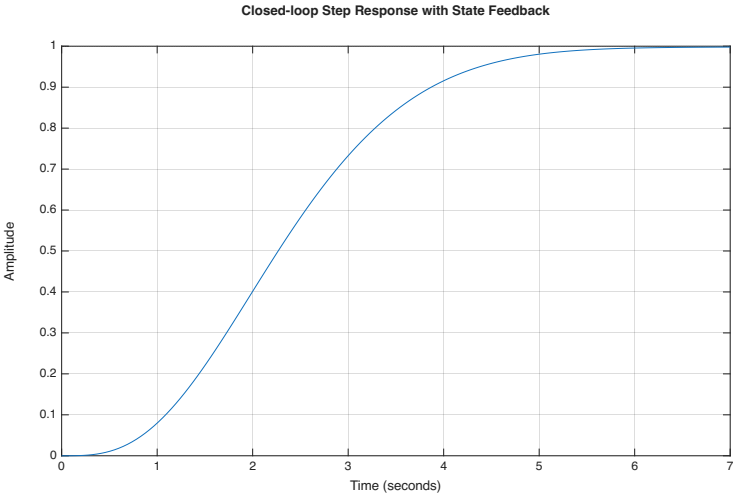

Then the zero of the system at -10 causes the phase to shift back by 90 degrees.

### Part C

Rise time: 19.502 s  
Settling time: 159.718 s  
Percent overshoot: 32.18 %  
Steady-state error: 0.000 rad

Part D

$K_p$	$K_d$	Settling Time (s)
Rise time	19.502	2.782
Settling time	159.718	4.984
Overshoot (%)	32.18	0
Steady-state error	0	0

Table 1: Settling times for different  $K_p$  and  $K_d$  values
